

Project Overview

The rootbeer project is an actively maintained Android library for root detection, with contributions spanning several years. It is critical to the company's mobile security initiatives and serves as a reference implementation for secure app development practices.

Highlights & Risks

- The project maintains strong ownership with Scott Alexander-Bown, ensuring continuity and quality
- Build scripts and project configuration are frequently updated, indicating ongoing modernization and preparation for integration with new Android SDK versions.
- Documentation and testing are adequately maintained, supporting project reliability

Git Tools & Insights

In analyzing project activity, the following Git command was useful:

- `git log --pretty=format:"%an,%ad,%f"` – Extracted commit authors and dates for contribution analysis.
